

# Scientific Data Analysis: data content, s/w environment

*EUSO main objective:*

detailed description of the  
**EECR spectrum**

together with a map of the  
**arrival directions**

*unique global result from*  
*“certified events”*

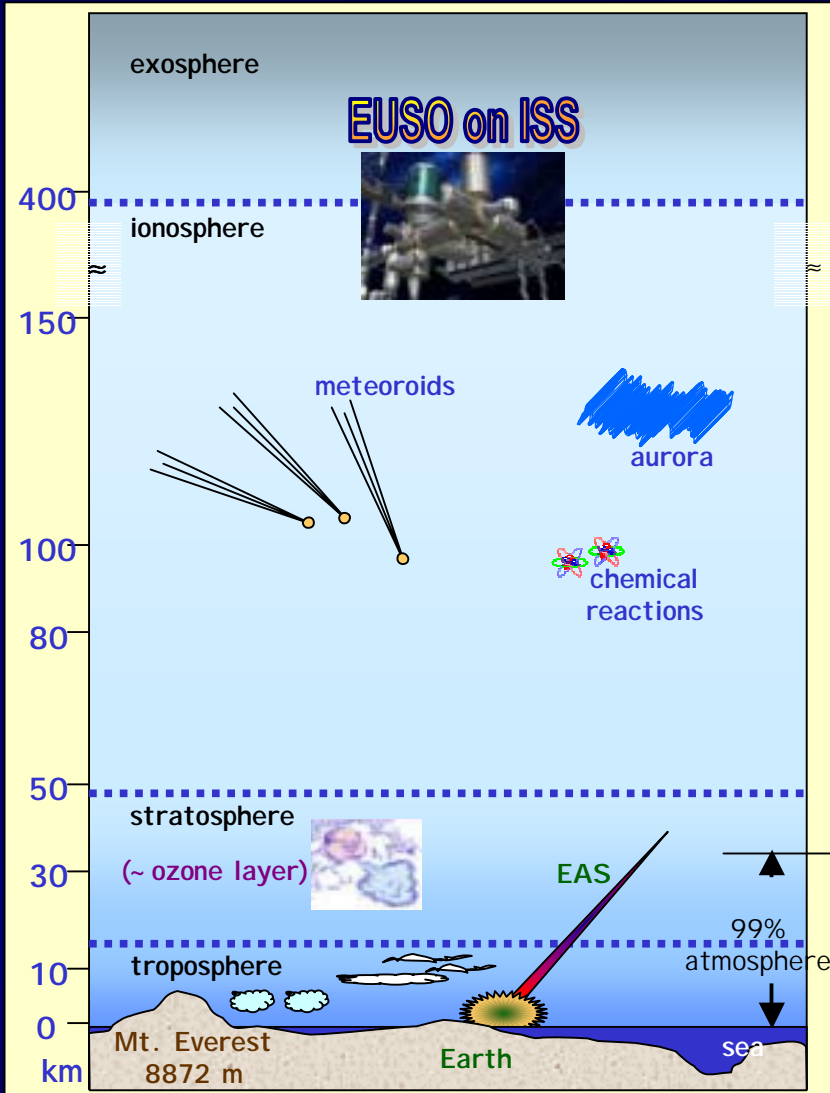

Housekeeping

Scientific data

Ancillary

# Scientific Data Analysis: data content

“Certifying” *EUSO* events

Instrument calibration

*EUSO* lab environment

Earth’s atmosphere

-- not modifiable! --

Instrumental response

Environmental parameters

- ✓ Ozone layer (*UV absorption*)
- ✓ Clouds (*hiding UV and/or Cherenkov signal*)
- ✓ Earth surface (*Cherenkov*)
- ✓ Temperature and pressure (*fluorescence yield*)
- ✓ Winds (*dusts, aerosol, microparticles transport*)

*variable with the seasons and with the geographical coordinates*

# Scientific Data Analysis: data content

“Certifying” *EUSO* events  $\leftrightarrow$  background discrimination

## Man-made sources

**Ships**

**Airplanes**

very slow moving sources

## Transient natural phenomena

**Lightning**

meteorological conditions

**Aurora**

direct or scattered

## Constant sources

**Chemical reactions**

depend on the local oxygen density

**City Lights**

attitude ISS information, geographical databases and maps

**Meteor**

different duration and propagation speed

**Starlight & Moonlight**

reflecting surface, moon phases

# Scientific Data Analysis: data content

Part of the information needed for the calibration and scientific data analysis will be measured on-board (“scientific and housekeeping data”).

External distributed information (“ancillary data”) will be necessary to complete the knowledge of the observation conditions and to “certify” *EUSO* events.

## Main source of “information”

- ❖ *EUSO* data: EECR/v and atmosphere sounding (Lidar)
- ❖ ISS data (time, attitude)
- ❖ geographical maps and databases
- ❖ moon phases

As much of this information as possible should be included in the final *EUSO* products for a proper scientific analysis.

# Scientific Data Analysis

## During EUSO Phase A

the Data Analysis Subsystem must be mainly devoted to:

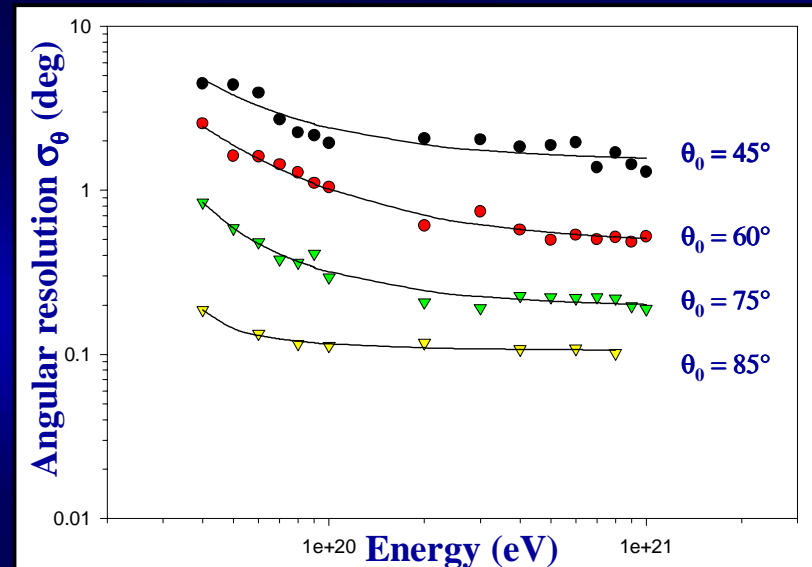

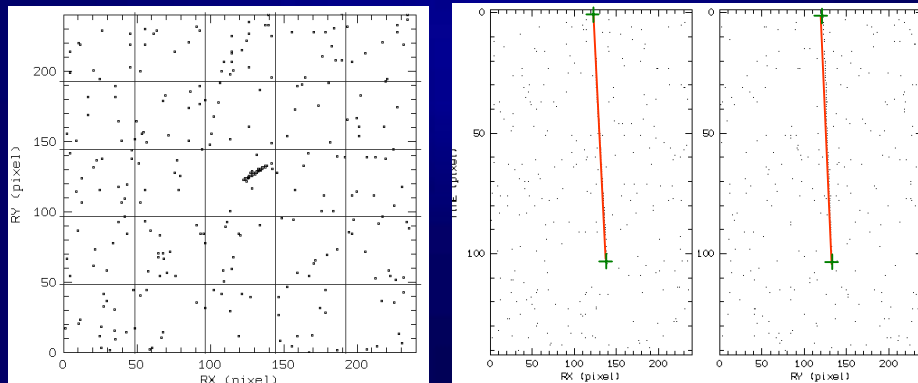

- ❖ definition of data content, size, and telemetry
  - *EECR/v, atmosphere sounding (scientific and housekeeping)*
- ❖ definition - first development of a data analysis package
  - *to reconstruct simulated data,*
  - *to study the EUSO instrumental response, and then*
  - *to help the optimisation of the instrument design itself*
- ❖ following a **time schedule** in accordance with the rest of **EUSO Phase A**.

# Scientific Data Analysis: track reconstruction

Arrival direction  $\rightarrow$  CARMF algorithm (Maccarone, 1999) *under improvement*

Geometrical combination of the slopes of the linear significant tracks along the two projection planes, taking into account the kinematics of the shower.

Energy reconstruction  $\rightarrow$  *work in progress (first results during Phase A)*

## ROOT

suggested as **good candidate** for the ***EUSO simulation and analysis software package*** both for the file format and the environment features

- ❖ interface to the standard astronomy formats (FITS, IDL)
- ❖ automatic documentation generation
- ❖ adopted by ground-based (Hess, Auger, Argo, Borexino) and space-based (Integral, GLAST) observatories as general S/W environment or for some specific tasks

# Scientific Data Analysis: data content, size, telemetry, analysis

Strict correlation with the other *EUSO* Subsystems, mainly:

➤ “Trigger & OBDH”

➤ “Atmosphere Sounding”

➤ “Simulations”

➤ “Ground Segment”

Who is part of the *EUSO* Subsystem 10 on  
“Scientific Data Analysis”?

***EUSO Meeting  
Annecy  
2-5 October 2001***

# *EUSO Meeting, Annecy, 2-5 October 2001*
